

u-Host

**Broadband is to the Internet,
what the Jet engine was to air travel**

The **u-Host** is a revolutionary new, low cost, dedicated web server operating over broadband, allowing you to be a web hoster. Just like the Jet engine took over from the propeller and opened the doorway to fast, economical, mass travel, the arrival of Broadband is the dawn of a new phase in totally distributed, low cost web hosting. The u-Host allows you to do so.

Operating at a speed 10-50 times faster than traditional dial-up internet access, Broadband is not just about faster web surfing, or faster downloads of bigger files. Broadband is the doorway to many new innovative applications distributed all over the internet.

Simple to use, yet powerful

Just like you do not have to be a mechanic, to be able to drive a car, you do not need to be a technical expert to use a u-Host. The u-Host Web Server Appliance has been specifically developed to be simple to use. It overcomes all the technically complex tasks of configuring and managing a web hosting server by automating all these functions behind an intuitive and simple to use menu driven interface. Together with on-line help, this allows non-technical people to setup and host websites without the need for in-depth technical knowledge.

Simple to install

The u-Host is a complete stand alone appliance supplied with all the software fully installed and configured, ready to run, straight out of the box. No need for any software loading, challenging configurations or steep learning curve.

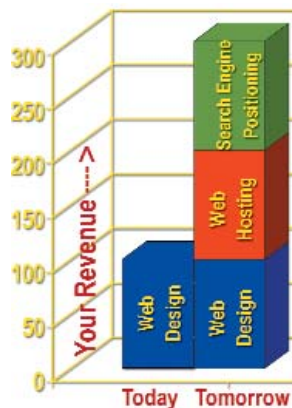

It does everything the big ISP can do...

It's just a little smaller

The u-Host performs all the functions of an Internet Service Provider (ISP), the only difference is in the scale. Whereas, typically an ISP will host 1000's of web sites for a large number of customers, the u-Host is designed for the small scale hoster with between 25 to 300 websites.

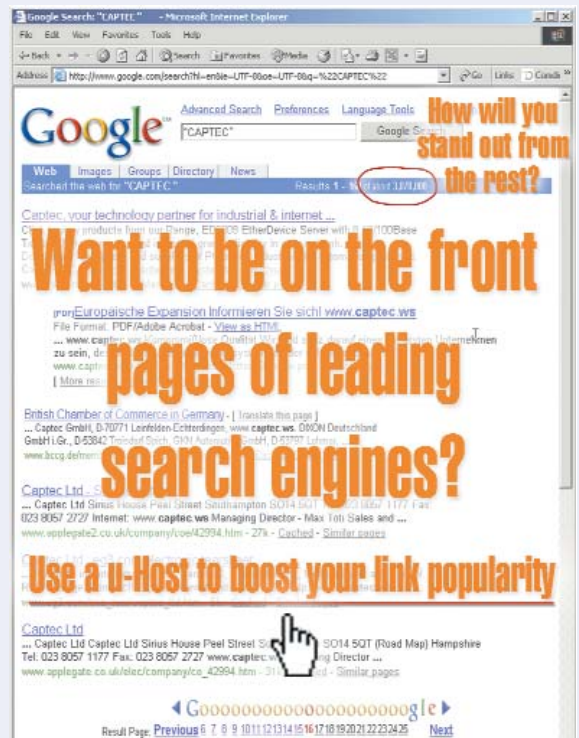

Ideal for web designers who can now maximize their income by hosting

Web designers can now expand their services to their existing customers by hosting the sites they create without losing highly profitable and re-occurring business to the ISPs.

Broadband Internet Web Hosting

**EXTRA
Profit from
Broadband**

Highly cost effective, the u-Host's hosting capabilities can be used to boost your **link popularity**. Link clone sites to your main website and propel yourself, or your customers, to the front pages of leading search engines. It's simple; just register domains with names using keywords related to your core business. For example, if you are a holiday operator you might use air-travel.com, sun-holidays.com, skiing-holidays.com, etc. Simply clone your master website to the new domains and point links from the clones to your master website. Submit your sites and watch your position soar.

u-Host . . . and become a small scale ISP

Remote web based management

All of the functionality of the u-Host is conveniently accessible via a browser interface from anywhere over the Internet. You can manage your u-Host from your office, home, or while you travel. The easy, intuitive and user friendly menu driven interface is simple to handle.

Simple 4 step set-up

The u-Host wizard guides you through four easy steps in personalising your u-Host with your specific settings.

Scalable website hosting options

The u-Host is scalable to suit your hosting requirements, or your budget. Available in 25, 50, 100 or 300 websites options.

Proven technologies

Based on proven industry standard technologies, you can trust your u-Host to provide reliable 24/7, un-supervised hosting.

Cost effective

Over 5+ websites the u-Host cost of ownership becomes significantly cheaper than equivalent traditional ISP hosting, while offering the additional benefit of in-house convenience and control.

Other application ideas

SME & dynamic entrepreneurs

SME companies who want to have greater ease of access and tighter control over their website(s). Coupled with ease of integration with in-house back office information systems which change in real time, eg. Stock availability, pricing, progression of orders and much more.

Education

In addition to teaching web design skills, schools, universities and colleges can now cost effectively host their students' creations for parents, friends, and prospective employers to see.

Corporate intranet

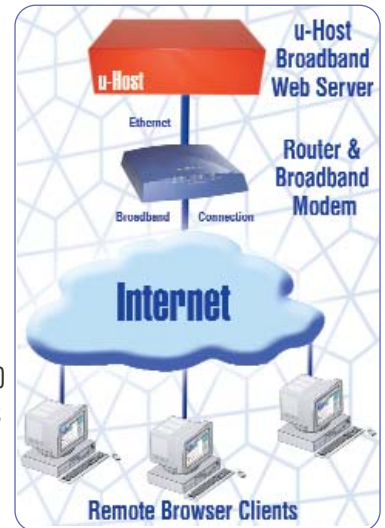

Departmental websites, document exchange, collaborative knowledge bases, can now be used to enhance groupware productivity. Unlimited internal mail accounts allowing every user to access email.

Local government & community services

Community services information hosting. Ideal for isolated small/rural communities who can create their own shared environment with different services each having their own web site.

All standard ISP web server features

- Web Server - Apache, CGI-BIN, Frontpage Extensions, Log Files
- Mail Server - SMTP, POP & Web Mail, Aliases, Forwarding, Spam Filters, Mailing Lists
- FTP Server
- DNS (Domain Name Server)
- Scripting Language Support - Perl, Python, PHP
- Database - MySQL, PHPMyAdmin
- Backup/Restore - Appliance, Site, User
- Remote Access - Telnet, SSH
- Site Activity Reporting with usage breakdown.

What you need to get started

- A Broadband Internet connection. There are many providers of broadband to choose from. We suggest you shop around for best value.
- Two Static (also known as Fixed) IP Addresses, one for your router, one for your u-Host (These are supplied by your service provider depending on the package you purchase)
- One registered Domain Name (This will be assigned to your u-Host server). For every additional web site you want to host you will need to register a new domain name.
- A temporary computer capable of running a web browser (PC, Laptop, Mac) for initial setup only. Thereafter, you can access it from any computer with an internet connection.
